

EC/ECD SERIES

FUNCTIONAL PRINCIPLE

The enthalpy heat exchanger is based on the principle of membrane permeability. Due to its atomic structure, the permeable membrane transmits latent thermal energy of water vapor in addition to sensible thermal energy. In winter, the supply air becomes humidified, while in summer it dehumidifies, thus keeping the room climate in a comfortable condition.

MEMBRANE OVERVIEW

The polymer membrane used in plate enthalpy heat exchangers is made of a hybrid polymer material. The product has high thermal efficiency and moisture transfer, air tightness, as well as excellent mechanical strength, acid resistance and thermal stability.

EC/ECD SIZES

Name	Geometry [mm]			Casing modification	Plate material
	A	B	h		
ECD-EX6 172	172	397	100-600	5/5.1	Membrane
EC-EX6 230	230	455	100-600	1/1.1/3/3.1	Membrane
EC-EX6 232	232	461	100-600	2/2.1	Membrane
EC-EX6 366	366	366	100-600	2/2.1	Membrane

DESIGNATION KEY

EC/ECD-EX6 - **366** / **100...600** - **2**

Commercial group

Height [mm]

Depth [mm]

Casing modification:

- 1 – aluzinc
- 1.1 – aluzinc + T-profile
- 2 – plastic
- 2.1 – plastic + T-profile

- 3 – aluminium
- 3.1 – aluminium + T-profile
- 5 – stainless steel
- 5.1 – stainless steel + T-profile

ADVANTAGES

High sensible and latent efficiency

No condensation

For hot and cold humid climates

100% high quality

Simple to install and maintain

Competitive prices and production times
